CPA. Handling a large graph

Maximilien Danisch

1 To get things started

Exercise 1 — Preparation

Download the following graphs:

- http://snap.stanford.edu/data/com-Amazon.html
- http://snap.stanford.edu/data/com-LiveJournal.html
- http://snap.stanford.edu/data/com-Orkut.html
- http://snap.stanford.edu/data/com-Friendster.html

All these graphs will enable you to check the results of your programs. You can, in addition, create (manually) a few small graphs and store them in files where each line is of the form: $u\ v$

which indicates that a link exists between nodes u and v.

Make a program that counts the number of nodes and edges in a graph and writes this value on the standard output. Test it on the 4 downloaded graphs.

2 Load a graph in memory

Exercise 2 — Three graph datastructures

Make three programs to read a graph and store it in memory:

- 1. as a list of edges,
- 2. as an adjacency matrix,
- 3. as an adjacency array.

Note that these three programs are important as they will be used in the future practicals. Make sure to have them working fine.

Use them on the 4 downloaded graphs and conclude on the scalability of the three programs.

3 Breadth-first search and diameter

Exercise 3 — BFS

Implement an efficient BFS algorithm.

Use your BFS algorithm to make an algorithm that computes a good lower-bound (and upper-bound) to the diameter of a graph.

Test your algorithm on the 4 downloaded graphs and report your lower bound as well as the running time of your algorithm.

4 Listing triangles

Exercise 4 — Triangles

Implement an efficient algorithm for listing triangles.

Test your algorithm on the 4 downloaded graphs. For each graph, report the number of triangles as well as the running time of your algorithm.
